

Process that we need to follow in case we want to restore a deleted project from CostOS but not from CostOS (SQL) data

1. First we need to know the Project Name, Project Code, and Project EPS of the deleted project (historical project).
2. Then we open SQL management Studio from the server where we had created the project (historical project)..
3. We write the following query and execute.

```
declare @databases table
```

```
(
```

```
    PK int IDENTITY(1,1),
```

```
    Name varchar(255)
```

```
)
```

```
INSERT INTO @databases (Name)
```

```
SELECT name FROM sys.databases WHERE name like 'cep_%';
```

```
declare @result table
```

```
(
```

```
    PK int IDENTITY(1,1),
```

```
    DatabaseName varchar(255),
```

```
    ProjectName varchar(255)
```

```
)
```

```
Declare @maxPK int;Select @maxPK = MAX(PK) From @databases
```

```
Declare @pk int;Set @pk = 1
```

```
DECLARE @dbName varchar(255);
```

```
DECLARE @prjName nvarchar(MAX);
```

```
DECLARE @out_param nvarchar(MAX);
```

```
DECLARE @sql NVARCHAR(1000);
```

While @pk <= @maxPK

Begin

```
set @dbName = (SELECT name FROM @databases WHERE PK = @pk);
set @sql = '(SELECT @out_param = cast(PVAL as nvarchar(MAX)) FROM
'+@dbName+'.[dbo].[PRJPROP] WHERE PKEY LIKE "project.name")';
```

```
EXEC sp_executesql @sql,
N'@out_param nvarchar(MAX) OUTPUT',
@out_param=@prjName OUTPUT
```

```
INSERT INTO @result (DatabaseName, ProjectName)
values (@dbName, @prjName);
```

Select @pk = @pk + 1

End

Select *

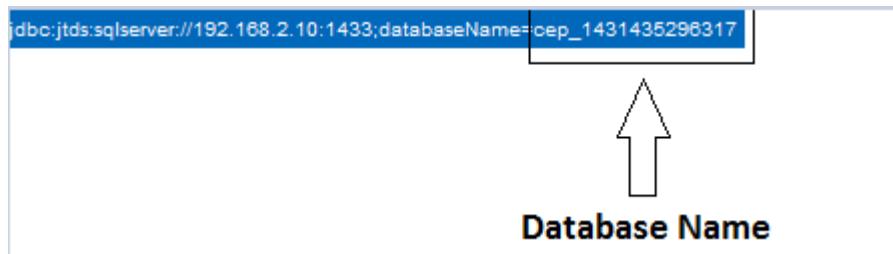

From @result

4. We get a table with all sql projects.

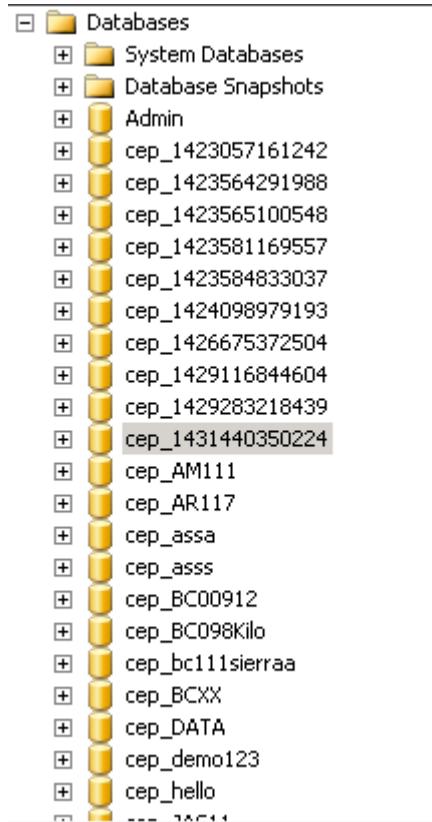

| | PK | DatabaseName | ProjectName |
|---|----|-------------------|---------------------------|
| 1 | 1 | cep_1423057161242 | B081 T4 IDL Refurbishment |
| 2 | 2 | cep_1423564291988 | TEST PROJECT |
| 3 | 3 | cep_1423565100548 | Test Project |
| 4 | 4 | cep_1423581169557 | Copying Excel |
| 5 | 5 | cep_1423584833037 | MM |

5. We search for the Database name of the project (historical project) that we are looking for (e.g. cep_146234233132)
6. Go back to CostOS app.

7. Create a new sql project with same project code, same EPS and write down the database name.

8. Go back to SQL database.
9. Find the database name of both projects, the historical and new one, from the left side of SQL window.

10. Copy the name of the new project on your clipboard.
11. Then delete the new project.
12. Paste the database name of the new project on the historical project, overwriting its previous database name.
13. Go back to CostOS and open the new project.
14. You will open the data of your historical project.
